Supplemental Methods

Study Measures

Job Interview Skills

The Mock Interview Rating Scale (MIRS) role-plays required participants to complete a job application and select two fictional job openings from a list of eight jobs before engaging in the role-plays (with role-play interviewers trained to fidelity). The role-plays were assessed across 8 job interview skills or items on a five-point scale from 1=poor to 5=excellent. An example of the anchoring system for the skill of ‘coming across as a hard worker’ reflects a rating of a ‘1’ for participants who make statements about “showing up late,” “missing work frequently,” and “avoiding responsibilities.”

Although the original MIRS consisted of nine items, we excluded the item targeting ‘negotiation’ where participants were instructed to ‘ask for Thursdays off’ during the role-play. Fewer than 40% of participants remembered to ask for Thursdays off during their role-plays. This approach is consistent with the efficacy studies of VR-JIT (1-5). Thus, this item was removed from the MIRS assessment for all future studies. Additionally, the MIRS interview role-play includes 13 required job interview questions plus three additional questions (randomly selected from a list of 90 optional questions). Four primary raters were trained by the principal investigator (PI) using 10 gold standard mock interview videos, and then their reliability was monitored to prevent drift by jointly scoring approximately 10% of all videos (ICC=.93). Three additional staff trained on the 10 gold standard videos and rated 38% of the reliability videos as they departed the project before completion: rater 5 (ICC=.99), rater 6 (ICC=.98), and rater 7 (ICC=.91).

Social Competence

The Social Skills Performance Assessment (SSPA) requires participants to complete a brief practice session and then role-play meeting a new neighbor and making a request from a landlord. Each scene was rated on a 5-point scale using anchors across eight criteria for the new neighbor scene (i.e., interest/disinterest, fluency, clarity, focus, affect, social appropriateness, grooming, overall conversation) and nine criteria for the landlord scene (i.e., interest/disinterest, fluency, clarity, focus, affect, social appropriateness, negotiation ability, submissive-persistent, overall argument). Example anchors include: “1=very disinterested. Impaired normal conversation. Asks virtually no questions; gives brief responses. Minimal initiation; passive listener.” We computed the mean item-level score for each scene and then computed the mean between scene-level means to reflect a single mean of social competence at pre-test and post-test.

Five primary raters were trained using the SSPA training protocol (6). Their coding reliability was monitored to prevent drift by jointly scoring approximately 10% of all videos (ICC=.97). One additional staff rated 50% of the available reliability videos prior to departing the project (ICC=.99).

Study Procedures

Recruitment

Employment specialists reviewed their caseload for potential participants, provided them with a study flyer, and referred them to either call the study coordinator or attend a research staff-led group presentation to learn about the study. Employment specialists also obtained verbal consent from interested participants for research staff to call and tell them more about the study. Potential participants were screened over the phone or after the presentation. Individuals

who passed the screener were later contacted to schedule two visits to provide informed consent and complete pre-test assessments.

VR-JIT Implementation

To facilitate hierarchical learning using lessons learned from the VR-JIT efficacy trials, study participants were asked to progress from easy to medium to hard virtual interviews. The recommended progression was visualized in a curriculum tracking form that VR-JIT implementers showed to participants and tracked with them. The progression is as follows. First, participants were required to complete at least three interviews on easy. If they achieved a score of 90 or higher on any of the first three ‘easy’ interviews, then they advanced to the ‘medium’ difficulty interview. If they did not score 90 or higher on their first three interviews then they had two more attempts to achieve 90 or higher. Participants then automatically advanced to ‘medium’ after completing five ‘easy’ interviews, regardless of score. This same model was followed to progress from ‘medium’ to ‘hard’ interviews. Then participants were asked to perform ‘hard’ interviews for the remainder of their training. During training, VR-JIT implementers were instructed that this recommended curriculum was flexible and could be adapted. For example, a participant who completed two interviews on easy and score 90 or better on both could potentially move straight to medium interviews without completing the recommended minimum of three interviews on easy before progressing to medium.

Data Analysis

Power Analysis

Prior efficacy studies of VR-JIT revealed medium-to-large effect-sized improvements in employment (e.g., OR=8.7), which we used to power the study. This is described in detail in our study protocol (7). A post hoc power analysis of our revised sample size (n=90) revealed $\geq 85\%$

power for a significant ($\alpha=.05$) two-sided test if the IPS+VR-JIT group has just over twice the employment rate of the IPS group by follow-up (e.g., 59% vs. 25%, or an OR = 4.3).

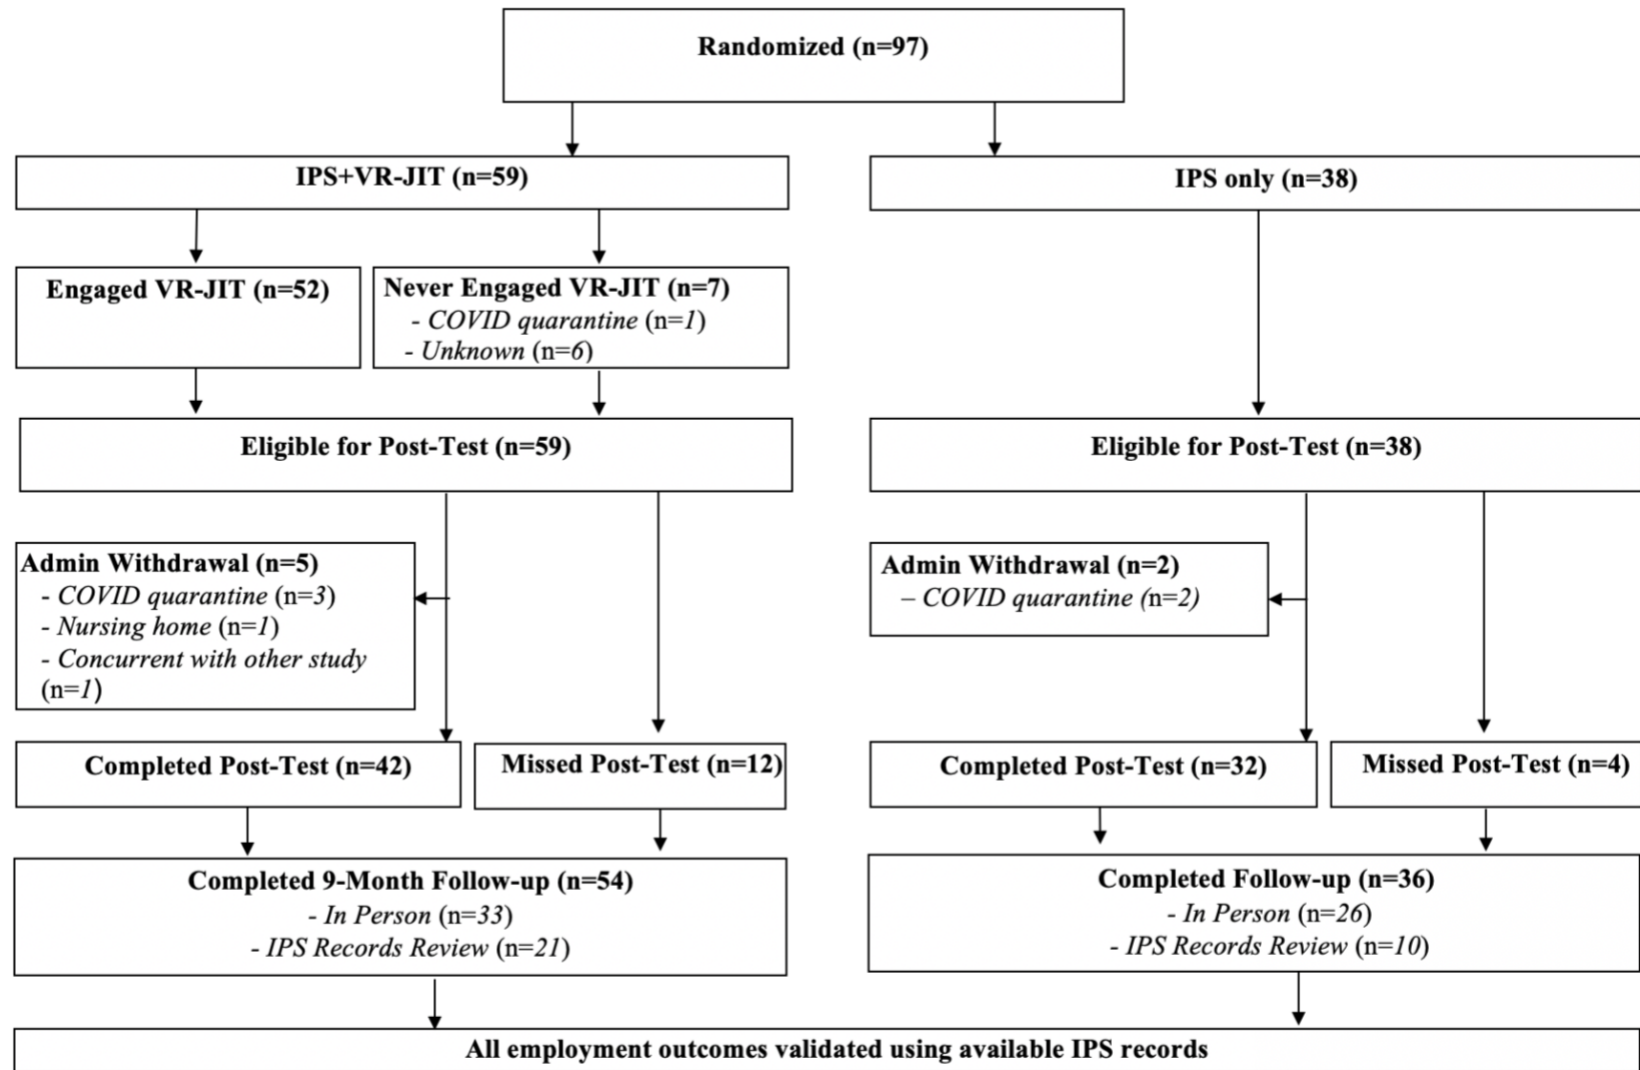

Missing Data

As noted in the manuscript, n=17 participants did not attend the post-test research assessment visit. Furthermore, n=10 additional participants did not complete the SSPA post-test due to the coronavirus pandemic or their geographic relocation. These extenuating circumstances required a remotely conducted post-test visit via a telephone call. The remote post-test visit required the study team to reduce the number of collected assessments to limit the burden on participants. Lastly, n=3 participants refused to complete the SSPA at the pre-test assessment visit.

VR-JIT Interface Featuring “Molly Porter”

Job Interview Training with Molly

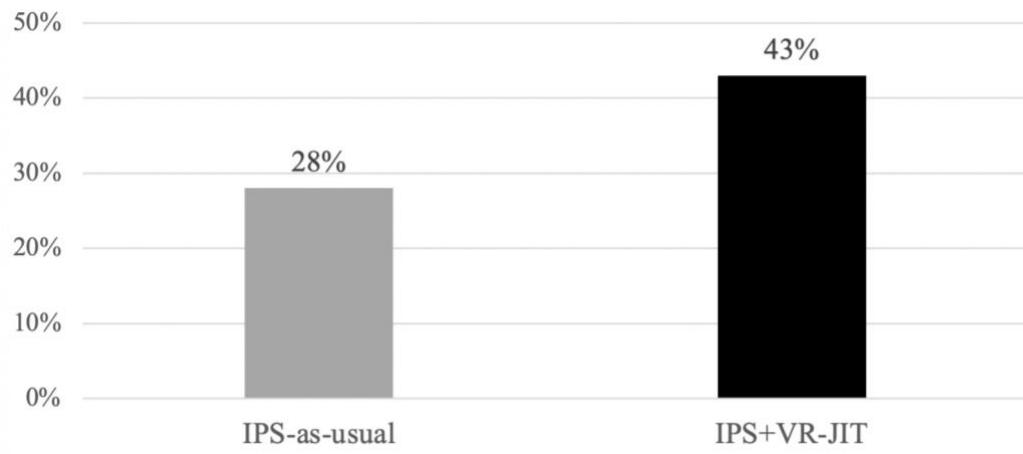

The interface features a top navigation bar with 'Talk', 'Transcript', and 'Notes' buttons. A search bar is located below the navigation bar. The main content area is divided into three sections:

- Video Feed:** Shows Molly Porter sitting at a desk in an office setting.
- Chat Window:** Contains the following messages:
 - Molly: "My name is Molly Porter, and I'll be conducting your interview today."
 - User: "First impressions matter, so be sure to return Molly's greeting in a polite and friendly manner."
 - Molly: "Thanks for inviting me for an interview."
 - User: "This is a good way to respond to Molly's opening statement."
- Response Options:**
 - Follow-on:**
 - No, I haven't seen the new store.
 - Yes, I have seen the construction.
 - Yes, I've seen it. I'm glad you're on schedule.
 - I haven't seen it, but I'm glad to hear you're on schedule.
 - Nope, haven't seen it.
 - I pass the site pretty often. It's been interesting to watch the progress.
 - Other:**
 - I may need a few small accommodations. Would you like to discuss that now?
 - I'm going to need accommodations.
 - I wanted to let you know that I also have another disability.
 - I have a condition that might mean I'll need some accommodations in order to perform this job. Should we discuss that now?
 - I have a disability.
 - Since I have a disability there are several accommodations I'll need in order to be able to perform the duties of this position.

Additional interface elements include a 'Slow Connection?' indicator, 'Options' menu, and buttons for 'Ask for Thursdays off', 'Share more', 'Other', 'Other questions', 'Ask about pay', and 'End the interview'.

Cumulative Hazard of Employment Across Time^a By Intent-to-Treat Study Condition (N=90)
Days to Employment or Censoring

^aDays from randomization to employment. Data were right-censored after 9 months (274 days), but no new employment occurred after day 235.

Supplemental Figure 5

Cumulative Hazard of Employment Across Time^a By Study Group Among Recent IPS Enrollees (N=44)

^aDays from randomization to employment. Data were right-censored after 9 months (274 days), but no new employment occurred after day 235.

Supplemental Tables

Supplemental Table 1

Primary outcomes: odds of obtaining employment by nine-month follow-up via multivariable logistic regression for IPS nonresponders (n=46)

Predictor variables	OR	95% CI	<i>p</i> ^b
Group (reference: IPS as usual)	5.82	1.56 ^a	.014
Baseline year	1.64	0.64-4.22	.305
Problematic substance use (reference: no)	3.90	0.80-19.03	.093
Social cognition	1.05	0.99-1.11	.108
Community functioning	0.97	0.91-1.02	.235
Negative symptoms (anergia)	0.72	0.41-1.25	.240

Primary outcomes: odds of obtaining employment by nine-month follow-up via multivariable logistic regression for recent IPS enrollees (n=44)

Predictor variables	OR	95% CI	<i>p</i> ^b
Group (reference: IPS as usual)	1.05	0.24 ^a	.477
Baseline year	4.64	1.13-19.01	.033
Problematic substance use (reference: no)	1.53	0.15-16.15	.723
Social cognition	1.06	0.99-1.13	.074
Community functioning	0.91	0.84-0.99	.021
Negative symptoms (anergia)	0.77	0.53-1.13	.184

Note. OR = odds ratio; CI = confidence interval. IPS nonresponder logistic regression model fit statistics were $\chi^2(6) = 15.65$, $p = .016$; Nagelkerke $R^2 = 0.394$. Recent IPS enrollees logistic regression model fit statistics were $\chi^2(6) = 18.53$, $p = .005$; Nagelkerke $R^2 = 0.470$.

^aCI for directional intervention hypothesis only uses a lower limit confidence interval. ^b1-sided *p*-value for directional intervention hypothesis, 2-sided *p*-value for covariates/factors.

Supplemental Table 2

Primary outcome: time-to-employment by nine-month follow-up via multivariable Cox proportional hazards model for IPS nonresponders (n=46)

Predictor variables	<i>HR</i>	95% CI	<i>p</i> ^b
Group (reference: IPS as usual)	2.70	1.03 ^a	.044
Baseline year	2.16	1.08-4.31	.332
Problematic substance use (reference: no)	3.55	1.05-12.04	.047
Social cognition	1.05	1.01-1.09	.087
Community functioning	0.95	0.91-0.99	.136
Negative symptoms (anergia)	0.78	0.57-1.04	.328

Primary outcome: time-to-employment by nine-month follow-up via multivariable Cox proportional hazards model for recent IPS enrollees (n=44)

Predictor variables	<i>HR</i>	95% CI	<i>p</i> ^b
Group (reference: IPS as usual)	1.19	0.44 ^a	.466
Baseline year	1.83	0.90-3.72	.093
Problematic substance use (reference: no)	1.32	0.32-5.49	.700
Social cognition	1.04	1.00-1.07	.050
Community functioning	0.97	0.92-1.01	.152
Negative symptoms (anergia)	0.86	0.64-1.17	.349

Note. *OR* = odds ratio; *HR* = hazard ratio; *CI* = confidence interval. IPS nonresponder Cox proportional hazards model overall fit statistic was $\chi^2(6) = 15.13, p = .019$.

Recent IPS enrollees Cox proportional hazards model overall fit statistic was $\chi^2(6) = 14.16, p = .028$.

^aCI for directional intervention hypothesis only uses a lower limit confidence interval. ^b1-sided p-value for directional intervention hypothesis, 2-sided p-value for covariates/factors.
